Intelligent Lift Interlock System (ILIS501-DC) - Installation Instructions

Ford Econoline – 6.0L Diesel Engine 2004

To aid in installation, first gain access to the connection points. Remove the lower dash panel below the steering column. Also, gain access to the lift power switch and the lift door switch circuits. These are usually accessible in the front control panel. It is not necessary to cut any Ford wires during the installation of the ILIS wire harness.

LED DISPLAY PANEL – Using the supplied Velcro strips, mount the display panel to the right of the steering column on the dashboard. Ensure that the panel is visible from the driver’s seat before securing. Run the display wire harness through the rubber seal between the steering column and the dash. Snap the 6-pin connector into the matching connector in the ILIS main control module. Ensure that the connector is fully seated. Do not permanently mount the control module until the main harness is installed.

MAIN HARNESS - Position the main harness such that the 12- pin connector is in position to be installed into the control module. The connector should not be installed into the module until the main harness is fully installed. All connections must be made with ignition power OFF! The connection points to be made for the installation of the main harness are listed below.

Shift Lock Circuit – Locate the Ford shift lock solenoid on the steering column and disconnect the black 3-pin connector. Be careful not to break the plastic tab on the connector. Insert the black female 3-pin connector from the main harness into the shift lock solenoid. Ensure that it is fully seated into the solenoid. Insert the black male 3-pin connector from the main harness into the connector that was originally installed in the shift lock solenoid. It is imperative that these connectors mate with the tabs on the same side. Use the small wire tie to secure the two tabs together. These connectors must not be allowed to separate!

Lift Power Circuit – Locate the lift power switch. Disconnect the circuit from the switch that goes to the lift relay. Note: this must be a power switch, not a grounding switch. Connect this circuit to the Blue/White wire from the main harness with a spade terminal. Connect the Yellow wire from the main harness to the power switch using a spade terminal. The lift power circuit must only activate the lift power relay/solenoid and must not draw more than 7.0 Amps. Do not power any other loads (ie: lights, motors, etc.) off this circuit.

Lift Door Circuit – Note: the door switch must provide a ground with the door open. A switch that provides power with the door open will not operate correctly! Locate the lift door switch circuit. Connect the Red/White wire from the main harness to this wire by stripping the insulation, soldering, and taping.
Park Output Circuit – This is an optional circuit that provides a ground in Park gear only. This circuit is useful if the operator wishes to activate or deactivate an accessory only in Park (ie: power operated front door). Attach the White wire of the main harness to the ground side of the accessory. If this option is not desired, cut the wire at the 12-pin connector and discard the wire. **Note: This output can only carry low current loads such as a relay primary coil. Higher loads can cause damage to the control module. The current of the load must first be determined and can not exceed 500 milliamps continuous load. This wire must not be attached directly to power without a load, or damage to the control module will result!**

Data Link Harness – Locate the vehicle Data Link Connector. It will be mounted below the lower dash panel on the driver’s side. (See photo). Remove the 2 mounting screws for the Data Link Connector. Plug the red connector from the ILIS Data Link Harness into the vehicle Data Link Connector. Ensure the connection is fully seated and secure with a wire tie. Mount the black connector from the ILIS Data Link Harness where the vehicle Data Link Connector originally was. Secure the ILIS Data Link Harness such that it does not hang below the lower dash panel.

Plug the 4 pin connector from the ILIS Data Link Harness into the Ford Gateway Module. Also, plug the 6 pin connector from the ILIS main harness into the Ford Gateway Module.

Finally, plug the 12-pin connector of the main harness into the ILIS main control module. Make sure the connector is fully seated. Secure the control module on the metal support bracket behind the lower dash panel using 2-sided foam tape or wire ties. Also secure the Ford Gateway Module. Check for proper operation.
Intelligent Lift Interlock System - New Style LED - Installation Instructions

**LED DISPLAY PANEL (6-Pin Connector)** – Locate a suitable position on the dashboard, within view of the driver for the mounting of the ILIS LED Display Panel. The length of the display harness is 40”. This is the maximum distance the display can be from the ILIS control module. Drill a 1” hole in the dashboard where you wish the center of the display to be. Attach the 6-pin end of the LED harness to the ILIS control module. Run the 10-pin end of the harness under the dash and out through the 1” hole. Attach the 10-pin end of the display harness to the ILIS LED Display Panel. Ensure panel is level, and secure using the supplied screws.

The two blunt cut wires (red and black) are for optional backlighting of the lower icons. There are three installation options:

1. Do not connect the wires. The display will function properly, but the lower icons will not be backlit.

2. Connect the black wire to ground and the red wire to a 12V ignition switched power source. This will allow the lower icons to be backlit with the ignition in the “on” position.

3. Connect the black wire to ground and the red wire to a 12V headlamp switched power source. This will allow the lower icons to be backlit only when the headlamps are on.
Post Installation Instructions
ILIS 401/501/502/601/602/604

Upon completion of installation of the Intelligent Lift Interlock System, the following procedure
MUST BE PERFORMED TO VERIFY PROPER INTERLOCK INSTALLATION AND FUNCTION:

- Set Park Brake, place transmission to Park position, close lift door, and turn Lift Power Switch to
  the off position. Turn ignition to the “Run” position. Do not start vehicle.

- Verify LED prove-out on LED Status Panel
  - All five (5) LEDs should illuminate for approximately one (1) second upon initial power on.

- Verify that the Park LED, the Park Brake LED, and the Shift Lock LED remain illuminated.

- Place foot on service brake and attempt to shift out of Park. Shift lever should not be allowed to
  shift out of the Park position. If shift lever is allowed to move, check for loose connections at all
  connection points.

- Release Park Brake. Verify Park Brake LED and the Shift Lock LED on the LED Status panel are
  no longer illuminated. Remove foot from service brake and attempt to shift out of Park. Shift
  lever should not be allowed to shift out of the Park position. If shift lever is allowed to move,
  check for loose connections at all connection points.

- With Park Brake still released, place foot on service brake and attempt to shift out of Park. Shift
  lever should now be allowed to shift out of Park position. Verify that all LEDs are not illuminated
  with transmission in any other gear. If shift lever is not allowed to move, check for loose
  connections at all connection points.

- Place shift lever back to the Park position and verify that the Park LED on the LED Status Panel is
  illuminated.

- With Park Brake still released, have an assistant open the lift door(s). Verify that the Lift Door
  LED and the Shift Lock LED on the LED Status Panel are now illuminated. Place foot on service
  brake and attempt to shift out of Park. Shift lever should not be allowed to shift out of “Park”
  position. If shift lever is allowed to move, check for loose connections at all connection points.

- Set Park Brake. Verify that the Park Brake LED on LED Status Panel is again illuminated. Turn
  on Lift Power Switch. Verify that the Lift Power LED on the LED Status Panel is now illuminated.
  All five (5) LEDs on the LED Status Panel should now be illuminated. Have assistant verify lift
  operation. Lift should now be operational.
• Release Park Brake. Verify that the Park Brake LED and Lift Power LED on the LED Status Panel are not illuminated. Have assistant attempt to operate lift. Lift should not be operational. If lift operates, check for loose connections at all connection points.

• If any irregular operational issues persist, contact InterMotive at 530-823-1048 for technical assistance.
Intelligent Lift Interlock System (ILIS) – Operating Instructions

The Intelligent Lift Interlock System (ILIS) is a microprocessor driven system for controlling wheelchair lift operation. Lift operation will only be allowed when all of the following conditions are met:

1. The vehicle is in “Park”
2. The parking brake is applied.
3. The vehicle ignition is on.
4. The lift power switch is on.
5. The lift door is open.

The Intelligent Lift Interlock System (ILIS) also will not allow the vehicle to be shifted out of park if the lift door is open. As an added feature, it also will not allow the vehicle to be shifted out of park anytime the parking brake is applied. This feature eliminates excessive parking brake wear due to driving with the parking brake applied.

When the vehicle is first started, or if the key is turned to the “Run” position the five LED’s on the display panel will illuminate for 1-2 seconds as a prove out of the LED’s. After prove out, the operation of the LED’s are as follows:

- Lift Power – Illuminates in green if power is available to the lift. This means that all conditions for lift operation have been met.
- Park Brake – Illuminates in red when the parking brake is applied.
- Park - Illuminates in red when the vehicle is in park range.
- Door Open - Illuminates in red when the lift door is open.
- Shift Lock - Illuminates in amber when the lift door is open and/or the parking brake is applied. If illuminated, the driver will not be allowed to shift out of park.

All five LED’s must be illuminated for the lift to operate.

The LED’s can also be used for diagnostic purposes. For example, if the Door Open LED is not illuminated when the lift door is open, the lift will not operate. This means that the ILIS module does not detect that the door is open. Thus, the technician should inspect the lift door switch and its circuit.
