for complete details.*

Blackout Module

The Blackout Module (BOM) deactivates exterior and interior vehicle lighting to aid in covert and surveillance operations.

When enabled, the BOM turns off all exterior lights including headlights, parking lamps, reverse lights, turn signal lights and service brake lights. It also turns off dome lights, dims the instrument cluster and mutes alert chimes.

The BOM is deactivated manually or by exceeding the configurable auto-exit speed. Maximum speed is programmed between 5-20 MPH to automatically return brake light operation for safety purposes.

IdleLock with AutoSense™ Technology*

IdleLock with AutoSense Technology is an automatic theft deterrent system that is activated when the officer exits the vehicle with the key fob.

The system locks the transmission in Park while the engine idles, providing continuous power to vehicle equipment.

IdleLock is instantly disabled when the officer re-enters with the key fob, and allows the vehicle to be immediately shifted into gear.

An output is also provided for disabling the weapons rack or rear hatch release 10 seconds after the fob leaves the vehicle.

Officer Protection Package

The OPP is available for Dodge Charger and Durango Pursuit vehicles. The system senses motion behind the vehicle by activating the rearview display and monitoring sensors.

If the sensors are triggered, audible and visible cues will alert the officer, allowing for a few critical seconds to respond.

Police Interface Module

The Police Interface Module (PIM) is a multi-function module designed specifically for law enforcement vehicles and provides a combination of popular features in one module.

Standard features include Intelligent Switch Mode (programmable steering wheel switches), Chime Mute Mode, Engine Stop/Start Override, Auto Park Override and Auto Sport Mode.

Optional features include Blackout Mode, IdleLock with AutoSense Technology and Surveillance Mode. Also optional is a weapons rack and rear hatch disable feature.

Surveillance Mode Module™

The Surveillance Mode Module (SMM) is designed to increase an officer's situational awareness when parked and working inside the vehicle.

The SMM detects movement behind the vehicle using the OEM reverse sensing system, camera and cross traffic sensors (if equipped).

When the sensors are tripped, the SMM will automatically sound an alert chime, roll up the driver and passenger windows, lock the doors and flash the rear lights.

An output is also provided from the module for other functions, such as activating the light bar and/or siren.

Upfitter Interface Module®

The Upfitter Interface Module (UIM) provides access to CAN vehicle data, (such as MPH, RPM, brake status and temperatures) in order to activate or control equipment in customized ways.

Up to eight outputs can be programmed using boolean logic (AND, OR, =, < and > statements) to create the desired conditions.

Each output can be custom configured as momentary, latching, time-hold, time-delay or flashing.
